

Kaan's Cover Letter

Hi Hiring Team,

I'm Kaan — Melbourne-based Senior Android engineer (9+ years) — and I'm applying for the Mobile Developer role. What grabbed me straight away is the “mission-critical” part: building a platform that's used day-to-day by councils, governments and businesses, where reliability actually matters (not just “nice to have”). The examples in the role description — disaster recovery, national parks and critical infrastructure, and places like the Australian Parliament House precinct — honestly sounds like the kind of work I tend to care about the most.

Most of my career has lived in high-trust, regulated, or just plain high-stakes domains: payments/fintech, crypto, logistics, and government. Recently at Tip.mi, I built a greenfield Android app in Jetpack Compose and also shipped a Compose Desktop admin panel through to beta, including analytics via Grafana and Mixpanel. At Zeller, I delivered Tap-to-Pay using Kotlin Multiplatform and worked through PCI requirements, while modernising a terminal app from RxJava/MVVM to Coroutines + MVI + Compose. I've also been on the “public service” side at PTV, where the bar for stability and user trust is very real.

A few things I think line up well with what you're after:

- **Native Android + modern UI:** Kotlin, Compose, coroutines, modularisation, clean architecture (MVI/MVVM), and pragmatic migrations when legacy is involved.
- **SDK / device & platform features:** maps/GPS + geofencing (Coles Express), biometrics/keystore, deep links, notifications, hardware integrations (biometric scanning devices in earlier roles), plus the usual networking stack (REST/gRPC/GraphQL/WebSockets).
- **Testing and shipping confidence:** I'm big on automation that teams actually keep running. I've expanded E2E automation with parallelised Maestro runners and worked on parallelisation support of Maestro the testing framework itself, contributing it's greatest feature: Sharding capability; I've also led CI/CD with GitHub Actions + Fastlane, secure signing, staged rollouts and release automation.
- **Cross-functional collaboration:** I'm comfortable working closely with designers, QA/testers, and API teams (and I'm not shy about asking the questions early so we don't discover “surprises” in prod :P).

If I'm being completely honest, I just like building apps that people depend on. I get a bit obsessive about the little details that make a product feel solid — performance, failure modes, logging/analytics that tell the truth, and the kind of testing that catches regressions before customers do.

I'd love to chat about what your mobile roadmap looks like and where you need the most lift (greenfield features, platform work, test reliability, architecture, all of it). Thanks for reading — and yep, I got a little carried away writing this, but the role sounds genuinely exciting.

Warmly,
Kaan Osmanagaoglu
