

Dear Chris,

I'm applying for the Android Developer position with Services Australia which we all frequently use in our daily lives. The linked government services have improved over the years and as someone who has worked for government clients, large and startup companies before, I really appreciated the quality of the work provided for government services.

Currently working for Coles group, I've architected the Coles Express store chains' new interface to pay at fuel pumps using our phones, which is soon going live !

Throughout my career I have taken part in really exciting projects and one of them was with Public Transport of Victoria, another government client. Again I've taken an important part in architectural decisions and implemented cutting edge UI elements for this app that everyone in Melbourne is currently using. The live animations that indicate positions of public transports entirely belong to me, along with many features.

Another exciting project has been with the Praesidium - a contractor of Department of Defense. For this client I have built an android tablet interface as a controller for Unmanned Ground Vehicles. This required training interns and intense cooperation with electronic engineers and mechanical engineers, among a really young team. So I'd mention that this required me to take lead and organize the backlog, keep everyone motivated and organized as we worked with many interns.

Similarly to my last mention, I worked at Suncorp Bank, which was a colossal project that consisted of teams working across Brisbane, Sydney and Melbourne. This was the first time I was introduced to android architectural patterns such as MVVM.

Apart from the experiences I try to summarize here, I've worked in RSA, Mobey, Grabba and other contract roles that were at both large companies and startup companies. Honestly I think this gives me a great perspective regarding the formalities in a large company and the communion of a startup company. Over the years these experiences have taught me a lot, so it wasn't only technical; although I've had quite an opportunity to structure large projects and provide direction for apps that were used by millions of people daily. Although most of my career was in Queensland, I haven't been shy of moving to Melbourne and finished new projects for new government clients down south.

For me it would be very important and exciting to be giving direction to enthusiastic projects in our government, I couldn't be happier switching to a permanent role anywhere else ! I think it's essential that services Australia gives me the opportunity to not only work here, but contribute in every way including making architectural decisions or help give direction to the project at hand, because I trust my coworkers' recommendations over the years to be an indicator of exceptional services, which I'd be proud to share with services Australia.

Kind regards,
Kaan Osmanagaoglu
