Software Engineer - Multiple Opportunities

Saab Australia, Melbourne

Dear Saab Australia team,

I am applying for the Software Engineer opportunities in Melbourne because Saab sits exactly where I want my next role to be: complex defence systems, mission-critical software, secure systems integration, and products where correctness, traceability and team judgement matter.

I am not coming to this as a mobile-only engineer trying to stretch into systems work. Earlier at RSA (EMC/Dell), I worked on RSA BSAFE cryptography components in C/C++/ASM, with Python automation around buildbots, pipelines, repeatable validation, HSM integration and mobile-security PoCs. That gave me a practical respect for low-level correctness, security-sensitive change control, and code that can be trusted.

WHY THIS MAPS TO SAAB

At Praesidium Global, I architected unmanned ground vehicle control software for Australian defence work across operator HMI, C/Python networking, ROS, Lidar/sensor communications, backend integration and field-readiness.

At Quest Payment Systems and Zeller, I carried the same high-trust mindset into certified payment-terminal systems: PayWave, Tap-to-Pay, PCI constraints, secure key handling, encryption, offline transaction flows and production debugging.

The Saab role reads like a strong fit because it is not just asking for someone who can write code. It is asking for someone who can participate in architecture decisions, review and guide code, collaborate with product owners and engineers, troubleshoot hard issues, support releases, and work within system requirements. That is where I can contribute quickly: implementation, architecture, integration, testing, release discipline and maintenance in domains where failure is expensive.

Technically, I bring Java/Kotlin depth from years of production platform work, plus C/C++/Python systems experience, Bash/build automation, Git-based configuration management, test automation, API/backend integration, Linux-oriented tooling and HMI work. I am comfortable across procedural and object-oriented codebases, and I care about keeping software understandable, traceable and maintainable after the first delivery pressure has passed.

I also like Saab's stated values of Trust, Drive and Expertise because they match the engineering culture I work best in: direct communication, ownership, careful judgement, and curiosity that keeps improving the system instead of just closing tickets. I am Melbourne-based, comfortable with the required workforce screening and defence/security clearance process, and I would be excited to bring my cryptography, robotics, secure-payments and full-lifecycle software background into Saab Australia's Systems Delivery Group.

Best,
Kaan Osmanagaoglu
